Dear Hiring Team,

I am currently completing my Software Engineering degree with a specialization in Data Science and Artificial Intelligence at ESPRIT, and I am very interested in joining OMV as a Data Scientist, the opportuniy of data, digitalization, and organizational impact really attracts me. This internship would form my final-year engineering project (PFE) and take place just before my graduatio, making it an important bridge between my academic training and the beginning of my professional career.

I first gained professional experience in Data Science during an internship at Konnect, a FinTech company, where I worked with transactional data on exploratory data analysis, feature engineering, and anomaly detection using an LSTM Autoencoder. I am currently working part-time as a Software Engineer at Verlune, where I contribute to automating the agency's recruitment processes using technologies such as Playwright, Next.js, PostgreSQL, and Vercel. These experiences have allowed me to combine data-oriented problem solving with practical software engineering and automation.

Throughout my studies, I have also worked on several individual and team projects involving Machine Learning, Generative AI, automation, and data-driven systems. In a smart agriculture project, I contributed to a solution that uses environmental, weather, and agricultural data to provide irrigation and fertilization recommendations, combining IoT data with intelligent decision support.

To conclude, I am comfortable working in collaborative environments and enjoy approaching complex problems analytically while remaining focused on solutions that can actually be implemented. I am fluent in English and accustomed to working and studying in international environments.

Thank you for considering my application. I would be very pleased to discuss my background, motivation, and potential final-year project at OMV with you further.

Best regards,

Hind Chouaib
